

Simply the best way to drive a valve!

In addition to electric actuators for air dampers, Belimo offer comprehensive range of valves and valve actuators for controlled devices in HVAC Systems.

The Characterised Control Valve (CCV) is suitable for the modulating control of hot and cold water thanks to the integral characterising disc. The CCV also offers tight shutoff – a huge advantage over traditional globe valves when it comes to energy savings.

Energy saving is now more cost-effective with the motorised butterfly valves from Belimo. They are available nominal widths from DN50 to DN350 with fittings for PN6, PN10 and PN16. Thanks to the high-quality fittings these valves seal absolutely tight.

Belimo's PICCV pressure Independent Characterised Control Valve combines a differential pressure regulator with a 2-way control valve, giving you a range of valuable features to tackle the toughest flow control applications.

RETROFIT

Belimo supplies a comprehensive range of linear and rotary actuators specifically for retrofitting in existing installations. With the help of simple adapters, these actuators can also be mounted on various installed valves or dampers from almost all common manufacturers, giving the end user a choice when selecting a replacement for a faulty actuator. Compatibility with existing control equipment is made possible with the intelligent technology of the actuators.

Direct coupled actuators at especially exposed locations are often subject to extreme conditions. Aggressive gases, wetness, moisture, high levels of dust and dirt, as well as the cold and UV radiation shorten the service life. For this reason, Belimo has now developed the RobustLine® actuators. With their extremely resistant housings, they meet the highest requirements and guarantee IP67 protection.
